

Enterprise Cyber Security Solutions

Featuring Adept Pass—the industry's first A. I. Session Pass for preventing threats to cyber assets.

The industry has been challenged to develop easy, cyber security solutions that secure their assets from the Internet. Now, Adept Technologies has delivered with Adept Secure.

Adept Secure with Adept Pass

Since it was introduced in 2008, Adept Secure has provided 100% NERC-compliant protection against hacker attacks for clients in the hydropower industry.

Adept Secure streamlines the location of multiple legacy products that constitute firewalls and compromise performance in large organizations and replaces or fixes them that secures the enterprise-wide infrastructure.

Multiple open ports that are a feature of legacy systems render firewalls ineffective. Adept Secure eliminates the problems by laser-focusing on legacy products, malware and intrusion attempts.

An Industry First: Adept Keystroke Input Scrambling

When an authorized user types in a username and password, Adept Secure decodes the login keystrokes over an encrypted network link and activates a secure session pass in the computer's random-access memory (RAM). If the login is successful, Adept Pass activates a secure session pass for each web page that cannot be duplicated.

The computer's memory pointer is scrambled and only Adept Pass can unscramble it. The pass is unique for every login and cannot be accessed by any other application or device in the network. The pass times out based on the session time of the website and instructs the user to login again, whereupon it creates a new, unique encrypted pass.

Adept Secure Features

- Advanced Encryption Standard
- Unique, secure login sessions
- Unauthorized access attempts are redirected, tracked, and blocked
- Keystroke input scrambling
- Flexibility to secure one or more sites or individual web pages
- Instant attack alerts and intrusion-attempt alerts
- Malware monitoring and protection
- Eliminates costly security products that do not work

Enterprise Cyber Security Solutions

Featuring Adept Pass—the industry's first A. I. Session Pass for preventing threats to cyber assets.

Adept Secure

Available as a product or service, Adept Secure featuring Advanced Encryption—is a proven advanced security management system for protecting server networks from unauthorized users.

Adept Secure's encryption technology scrambles authorized users' login keystrokes so they cannot be used by hackers. The session pass can only be read by Adept Secure and unauthorized attempts to access any page are redirected to a login page.

Adept Secure technology is based on years of experience providing secure software protocols for utilities and government agencies. Previously these customers had to lock down their networks and, in the process, block valuable communication between the Internet and their systems. Now, Adept Secure gives these and other customers the ability to safely access information outside in real time.

A Cookie-less, Zero-footprint Innovation

Adept Pass was developed to be cookie-less, which means login info is not saved anywhere and there is no footprint. This innovative way of storing user credentials makes it impervious to hacking by standard methods.

Adept 24/7 Monitoring & Attack Alerts

Adept Secure monitors enterprise systems 24/7 for predator activity and malware. Its intrusion-attempt management feature sends instant attack alerts to your server security team. The alert contains the hacker's IP addresses and industry standard location and identity information. The hacker's IP addresses can be blocked automatically or by your security team.

With Adept Secure You Can:

- Protect servers, workstations, and mobile devices
- Add and remove websites
- Flag websites user and group accounts
- Manage alert emails
- Log user, IP address, date and time
- Access a website based on IP address
- Secure data transfer among systems

Security Intelligence Features

Adept Secure provides the following options for identifying hacking attacks:

- Prevent IP address from access
- Send email to user with options
- Send email to security team
- Deactivate compromised user account
